Touch screens and pixel read operations are not supported when the PIO interface is used. The new graphics functions include different size proportional fonts and formatting features. The GUIslice library will make use of this feature to speed up the rendering of GUI objects (see #769). Touch controller support The XPT2046 touch screen controller is supported for SPI based displays only. Examples have also been added to display PNG compressed images (note: requires ~40kbytes RAM). Only one SPI device can be connected to the FLASH pins and the chips select for the TFT must be on pin D3 (GPIO0). The library includes a "Sprite" class, this enables flicker free updates of complex graphics. The TFT_eSPI_ext library contains examples that demonstrate the use of the fonts. SPI port 0 is the default but SPI port 1 can be specifed in the setup file if those SPI pins are used. ESP32-DevKitC ESP32-S2-Saola-1 ESP32-C3-DevKitM-1 Add here the third party boards, listed by vendors. Significant additions have been made to the library to boost the speed for the different processors (it is typically 3 to 10 times faster) and to add new features. Sprites can be created and deleted dynamically as needed in the sketch, this means RAM can be freed up after the Sprite has been plotted on the screen, more RAM intensive WiFi based code can then be run and normal graphics operations still work. Direct writes to the TFT with graphics functions are still available, so existing sketches do not need to be changed. Further examples will be added. More than 3300 additional Fonts are available here. For more detailed information regarding the SoC¢ÂÂÂs and modules, see the Espressif Product Selector. Graphics can be drawn into the Sprite just as they can be drawn directly to the Anti-aliased Fonts Anti-aliased (smooth) font files in "vlw" format are generated by the free Processing IDE using a sketch included in the library Tools folder. Full screen Sprites take longer to render (~45ms for a 320 x 240 16 bit Sprite), so bear that in mind. Breadboard friendly If you are prototyping, this will be very useful to connect your board directly on the breadboard. You need to choose one that covers all your requirements. DMA can now be used with the Raspberry Pi Pico (RP2040) when used with both 8 bit parallel and 16 bit colour SPI displays. The library now supports SSD1963 based screen, this has been tested on a 480x800 screen with an ESP32. Anti-aliased (smooth) font files in vlw format stored in SPIFFS are supported. 8 bit parallel support The common 8 bit "Mcufriend" shields are supported for the STM Nucleo 64/144 boards and ESP32 UNO style board. Note Create one file per board or one file with multiple boards. Displays using the following controllers are supported: ILI9163 ILI9225 ILI9341 ILI9481 (DMA not supported with SPI) ILI9486 (DMA not supported with SPI) ILI9488 (DMA not supported with SPI) HX8357D S6D02A1 SSD1351 SSD1963 ST7735 ST7789 ST7796 GC9A01 ILI9341 and ST7796 SPI based displays are recommended as starting point for experimenting with this library. Do not add board information/description on this file. On an ESP8266 the largest 16 bit colour Sprite that can be created is about 160x128 pixels, this consumes 40Kbytes of RAM. Fonts and features can easily be enabled/disabled by commenting out lines. The SPI bus for the touch controller is shared with the TFT and only an additional chip select line is needed. December 2020 by cdaviddav Categories Microcontroller Post navigation Sound Sensor Tutorial for Arduino, ESP8266 and ESP32HC-SR501 PIR Motion Sensor for Arduino, ESP8266 and ESP32 Arduino-ESP32 You will need a development board or a custom board with the ESP32 (see Supported To start playing. The ../ at the beginning of the road means climbing a directory level. The library is based on the Libraries of the Adfruit GFX and Adafruit controller and the objective is to conserve compatibility. The parallel interface of 8 bits TFTS (E.G. one Format Mcfriend Shields) can be used with the Nucleus range 64/144 of STM32 or the UNNO format â €
